POPULATION SIZE, MIGRATION, DIVERGENCE, ASSIGNMENT, HISTORY

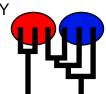

Bayesian inference using the structured coalescent

Migrate-n version 4.4.4(git:v4-series-26-ge85c6ff) [June-1-2019]

Compiled for a SYMMETRIC multiprocessors (Grandcentral)

Program started at Thu May 20 21:37:17 2021

Program finished at Fri May 21 00:19:44 2021 [Runtime:0000:02:42:27]

### **Options**

Inheritance scalers in use for Thetas:

All loci use an inheritance scaler of 1.0

[The locus with a scaler of 1.0 used as reference]

Random number seed: (with internal timer) 4079424891

Start parameters:

Theta values were generated RANDOM start value from the prior

M values were generated RANDOM start value from the prior

Connection matrix:

m = average (average over a group of Thetas or M,

s = symmetric migration M, S = symmetric 4Nm,

0 = zero, and not estimated,

\* = migration free to vary, Thetas are on diagonal

d = row population split off column population, D = split and then migration

### Bayesian Analysis: Posterior distribution for locus 1

Migrate 4.4.4(git:v4-series-26-ge85c6ff): (http://popgen.sc.fsu.edu) [program run on 21:37:17]

### Log-Probability of the data given the model (marginal likelihood)

Use this value for Bayes factor calculations:

 $BF = Exp[\ ln(Prob(D \mid thisModel) - ln(\ Prob(\ D \mid otherModel)$  or as LBF = 2 (ln(Prob(D | thisModel) - ln(\ Prob(\ D | otherModel)) shows the support for thisModel]

| Method                    | In(Prob(D Model)) | Notes |
|---------------------------|-------------------|-------|
| Thermodynamic integration | -3780.222501      | (1a)  |
|                           | -3394.500695      | (1b)  |
| Harmonic mean             | -3353.427033      | (2)   |

(1a, 1b and 2) are approximations to the marginal likelihood, make sure that the program run long enough! (1a, 1b) and (2) should give similar results, in principle.

But (2) is overestimating the likelihood, it is presented for historical reasons and should not be used (1a, 1b) needs heating with chains that span a temperature range of 1.0 to at least 100,000.

(1b) is using a Bezier-curve to get better approximations for runs with low number of heated chains

#### Potential Problems

This section reports potential problems with your run, but such reporting is often not very accurate. Whith many parameters in a multilocus analysi s, it is very common that some parameters for some loci will not be very informative, triggering suggestions (for example to increase the prior ran ge) that are not sensible. This suggestion tool will improve with time, therefore do not blindly follow its suggestions. If some parameters are fla

| gged, inspect the tables carefully and judge wether an action is required. For example, if you run a Bayesian inference with sequence data, for mac roscopic species there is rarely the need to increase the prior for Theta beyond 0.1; but if you use microsatellites it is rather common that your prior distribution for Theta should have a range from 0.0 to 100 or more. With many populations (>3) it is also very common that some migration rou tes are estimated poorly because the data contains little or no information for that route. Increasing the range will not help in such situations, reducing number of parameters may help in such situations. |
